Royal Caribbean

Problem Statement

Today, Royal Caribbean's marketing and content teams struggle to quickly find and confidently use approved digital assets for campaigns across web and email channels.

Creative assets are distributed across fragmented digital asset libraries with inconsistent or incomplete metadata, limited segment-to-content mapping, and manual rights verification processes. **As a result, content authors often spend days searching for suitable assets, validating usage rights, and assembling campaign-ready content.**

This slows speed-to-publish, reduces personalization and segment relevance, and creates operational friction across marketing, brand, and launch teams. Royal Caribbean needs a faster, safer way for content authors to discover and use the right assets while maintaining brand consistency and rights compliance.

Royal Caribbean

FDE Question

Can GenAI enrichment and semantic search improve speed without increasing risk?

Value Lens

Reduced time-to-publish and increased confidence in asset usage

Why FDE

Real data constraints, governance tension, AI-driven feasibility learning

Skills practiced: Data discovery, enrichment, RAG, value framing

Constraints & Risks

MVP only; not a Digital Asset Management replacement; no production hardening

Key Risk: Over-scoping into UX polish or DAM redesign

Royal Caribbean

Tech Stack

Core Platforms

- AWS Bedrock (LLM access and orchestration)
- OpenAI API (key provided by Royal Caribbean team)

Development Environment

- AWS sandbox account **or** local development environment
- Lightweight internal UI or notebook-based interface

Supporting Components

- Vector database for semantic search (implementation choice left to team)
- Basic ingestion and enrichment pipeline (non-production)

DATA

Data Available

- Mock DAM-style digital asset data
- Sample metadata fields (titles, tags, usage rights, channels, brands)

Data Shape

- Asset-level records (images, copy, creatives)
- Semi-structured metadata (JSON / tabular)
- Rights and usage constraints attached at asset level

Example Data

- Image asset with incomplete tags and unclear rights
- Enriched output adding:
  - Improved tags
  - Channel relevance
  - Rights visibility
